Data Analysis with Python

Cheat Sheet: Importing Data Sets

Package/Method	Description	Code Example 1, 1
Read CSV data set		1. df = pd.read_csv(<csv_path>, header = None) # load without header df = pd.read_csv(<csv_path>, header = 0) # load using first row as header Copied!</csv_path></csv_path>
		Note: The labs in this course run in JupyterLite environment. In JupyterLite environment, you'll need to download the required file to the local environment and then use the local path to the file as the CSV_path. However, in case you are using JupyterLabs, or any other Python compiler on your local machine, you can use the URL of the required file directly as the CSV_path. 1. 1
Print first few entries	Print the first few entries (default 5) of the pandas data frame	
Print last few entries	Print the last few entries (default 5) of the pandas data frame	Copied! 1. 1 1. df.tail(n) #n=number of entries; default 5
Assign header names	Assign appropriate header names to the data frame	Copied! 1. 1 1. df.columns = headers
Replace "?" with NaN	Replace the entries "?" with NaN entry from Numpy library	<pre>Copied! 1. 1 1. df = df.replace("?", np.nan)</pre>
Retrieve data types	Retrieve the data types of the data frame columns	Copied! 1. 1 1. df.dtypes Copied!
Retrieve statistical description	Retrieve the statistical description of the data set. Defaults use is for only numerical data types. Use include="all" to create summary for all variables	1. 1
Retrieve data set summary	Retrieve the summary of the data set being used, from the data frame	1. 1 1. df.info() Copied!
	Save the processed data frame to a CSV file with a specified path	1. 1 1. df.to_csv(<output csv="" path="">) Copied!</output>
